Level or Game Overview

Game overview: This game is a picture book-style puzzle game specially designed for young children, taking them on a "global journey". This game begins in the world of butterflies (taking butterflies as an example only, followed by butterflies as the main focus, but later on, butterflies will be replaced with other things). Players set out from the world map and freely choose the countries they are interested in. By completing the puzzle of the country's representative butterflies, they gradually explored a world rich in cultural and natural diversity. After each jigsaw puzzle is completed, the static images are transformed into vivid introduction content, allowing children to naturally gain a preliminary understanding of the different countries and creatures in the game.

Detail description: This game takes "jigsaw puzzles + content unlocking" as its core design concept, transforming traditional static jigsaw puzzles into learning experiences with extended significance. Each level is an "interactive picture book page", with themes covering animals, nature, vehicles, daily life scenes and other familiar contents for young children.

After entering the level, players will see a blank "canvas" where they need to place different puzzle pieces in the correct positions. The difficulty of the jigsaw puzzle will increase in a disguised way (for example, it will become irregular and the number of pieces will increase). However, the number of fragments is small, the shape is simple, and they are accompanied by color and outline hints to ensure that young children can complete them independently.

When the puzzle is completed, the game does not immediately move on to the next level. Instead, it transforms static illustrations into dynamic content through transition animations, playing a short video or animation, such as a video of a real animal, a simple science popularization animation, or a small story related to the scene. This design aims to establish a positive cycle of "hands-on completion → content rewards → knowledge association".

Overhead Map/Game Example Screen

The game's art style leans towards "Chuchel"

overall style: *The overall visual style of this project draws on the exaggerated shapes, hand-drawn textures and strong character expressiveness adopted by the game Chuchel, but makes clear distinctions and adjustments in terms of the target audience and emotional expression. Compared with Chuchel's style that leans towards absurdity, strong rhythm and adult humor, this game is visually more gentle and has a slower pace, emphasizing a sense of security, friendliness and child-friendliness. I want the overall style to lean towards the example picture on the right.*

Reference drawing for the style

Visual style description :

1.Styling style

In terms of the overall style, exaggerated yet rounded shape language is adopted, with sharp edges reduced to make the characters and objects more suitable for children's aesthetic and operational habits. However, for the puzzle, I want to maintain the feeling of the example picture while preserving the most authentic appearance of the butterfly.

2.Lines and texture

It continues Chuchel's hand-drawn feel and irregular line features, but with cleaner lines and lower contrast to avoid visual fatigue.

3.Color usage

Compared with Chuchel's high saturation and strong contrast, this project uses a softer and more unified color combination to highlight the atmosphere of a picture book.

4.Emotion and Rhythm

The animation rhythm of the picture slows down, reducing rapid jumps or exaggerated expression changes, and the overall conveys a warm, quiet and exploratory emotional tone.

Gameplay Summary

Gameplay summary: The gameplay of this game unfolds around the core cycle of "country selection - butterfly puzzle - content unlocking". Players use the world map as an entry point and freely choose the countries they are interested in to enter the levels. In each country level, players need to complete a butterfly puzzle that represents the characteristics of that country. After the puzzle is completed, the game will trigger an introduction related to the butterfly and its national background, thereby combining operational behavior with cognitive experience. The entire process has no time limit and no failure penalties. It emphasizes exploration, a sense of completion and positive feedback, making it suitable for young children to experience independently.

Core Gameplay Loop:

Select a country → Enter the Butterfly Puzzle level → Complete the puzzle → Play the introduction content → Return to the map or select a new country

Gameplay Steps:

- After entering the game, players will see the world map interface and select a country they are interested in
- The game loads butterfly puzzle levels corresponding to different countries and displays background scenes in the style of picture books
- Players move the puzzle pieces to the correct position within the butterfly's outline by dragging and dropping
- When the puzzle pieces approach the correct position, the system provides visual and audio prompts to guide the operation
- When players complete all the puzzle pieces, the butterfly image will be fully presented
- The game triggers the completion animation and automatically plays a brief introduction content (animation or video) related to the butterflies of that country.
- After the introduction content is completed, the game provides positive feedback and allows players to return to the world map or continue exploring other countries
